How will farming in the SE EU be affected by climate change?

Source: Adaptation to Climate Change in the Agricultural Sector AGRI-2006-G4-05, AEA Energy & Environment and ,Universidad de Politécnica de Madrid, 2007

Drought in SE Europe is not solely the matter of climate change

Period	Region / Countries affected	Economic costs (€ billion)
1976-77	Western Europe Cost of building damage due to land subsidence in London alone estimated at € 800 million	
1981- 82	Iberian Peninsula (Portugal, Spain, Southern France, Corsica, Italy)	> 5.0
1988- 91	Mediterranean Region (Portugal, Spain, Southern France, Italy, Albania, Greece)	> 2.1
1992- 94	Eastern Europe (Germany, Denmark, Poland, Lithuania, Hungary, Yugoslavia, Ukraine, Moldova)	> 1.1
1992- 95	Spain	> 3.7
2000	Central Europe (Romania, Hungary, Poland, Bulgaria, Greece, Yugoslavia, Czech Rep, Turkey, Germany)	> 0.5
2003	Europe (Romania, Hungary, Poland, Bulgaria, Greece, Yugoslavia, Czech Rep, Austria, Switzerland, Italy, Germany, Belgium, Denmark, Netherlands, Norway, UK, France, Spain, Portugal)	> 13.0

Europe 'will be hit by severe drought' without urgent action on emissions

Southern England would be badly affected – while Spain, Portugal, southern Italy, Greece would turn into semi-desert

David Adam in Copenhagen

Europe will be struck by a series of severe droughts that will make life "hell" for hundreds of millions of people unless urgent action is taken to

Problem identification – recent updates

Bulgaria: June 10, 2009 – wheat output to fall by 20% due to dry conditions

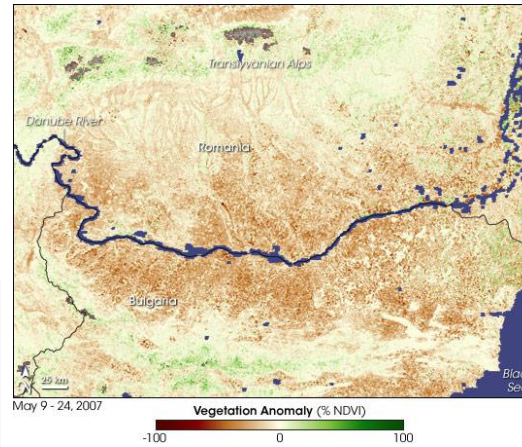

(Dnevnik.hr)

Hoće li Slavic stvari stoje - boca vode, a žedna, a usji kukuruz. Rati Suša je iscrp 'Ovdje je nek sada nema i Nema police

Slavonia, Croatia: May 24, 2009 - agriculture hit by drought; 90 days lack of rain

Oborina je palo čak 70 posto manje od prosjeka za ovo doba godine. Usjeve napadaju i nametnici. Sunce je spržilo većinu stočnog graška. Stoka će na prisilnu dijetu. 'Stoka neće imati što jesti. Prinos mi je smanjen za 60 posto, a novčanik prazan', očajan je Mario Milušić. Ratare hvata panika. U proizvodnju hrane uložili su mnogo novca. Ne padne li kiša uskoro, očekuje ih teška godina. Da kiša sutra padne, kažu, imat će opet 20 do 35 posto štete. Seljaci traže proglašenje elementarne nepogode. Jedino tako se mogu izvući iz finansijskih teškoća, jer osiguranje usjeva od suše ne postoji. 'Osiguravamo od požara i tuče, ali od suše ni u jednoj osiguravateljskoj kući ne postoji policia osiguranja', objašnjava Matija Brlošić, predsjednik Udruge poljoprivrednika

Moldova: 2007 – one of the worst droughts ever Romania and Bulgaria: 2007.

Turkey: Drought Cuts Food Production in Half

Posted On Jul 17

Environment

Production has been halved to 300 kilos (661 pounds) per 1,000 square meters (250 acres), even in well-irrigated parts of the region, as rainfall declined to one-fortieth of normal levels. Referans daily said on Wednesday, citing farmers and farming associations."

Turkey: 2008 - the most affected country in SE Europe in 2008.

The government has selected 35 of its 81 provinces as eligible for financial assistance, Erdogan said. Farmers who have lost more than 30 percent of their harvest to drought can claim assistance and also postpone any agricultural loan payments by a year, he added.

Although, compensation will be given to farmers, the decision has not been praised by farming organizations. "We were expecting 10 new Turkish kurus (YKr) compensation per kilogram, the offer of 5 Ykr is not adequate," member of the Union of Turkish Chambers of Agriculture's Board Mustafa Hepokur said on Tuesday.

AFFECT OF DROUGHT

Drought severely affects farmers in Turkey; this drought particularly has forced many

Bulgaria Sees Drought Slashing '09 Wheat Crop by 20% - Media

coding Jun 10, 2009 14:43 CET | Story | SeeNews - The Corporate Wire options

SOFIA (Bulgaria), June 10 (SeeNews) - Bulgaria expects wheat output to fall by 20% this year due to dry conditions, state-run news agency BTA reported on Wednesday.

The estimate is based on the assessment of crop condition by May 22, BTA (www.bta.bg) reported, quoting Deputy Agriculture Minister Svetla Bachvarova.

Bulgaria harvested 4.4 million tonnes of wheat from some 1.03 million hectares in

2008, the highest amount in four years and twice as much as the country needs to meet domestic demand.

Drought Management Centre for SE Europe Background

DMCSEE initiative – “top-down” approach started
in 2004 (A “Balkan Drought Workshop” in Poiana/Brasov (RO), co-sponsored by the UNCCD)

... developing in 2006 (Participants: UNCCD focal points, permanent representatives with the WMO + observers from UNCCD and WMO)

..and finally in September 2006: decision on
DMCSEE host institution (procedure led by
WMO).

DRAFT PROCESS FOR THE DMCSEE

What is DMCSEE?

Currently, DMCSEE is in its **“bridge project”** phase aiming at permanent functioning centre.

Most suitable project framework (in the frame of EARS) was found to be

Transnational Cooperation Programme for SE Europe

www.southeast-europe.net

Main aim of transnational cooperation programme is to foster a balanced territorial development and territorial integration within the cooperation area

-> **common infrastructure, not research!** Jointly for our common future

The duration of DMCSEE Project from April 2009 until March 2012.

The screenshot shows the homepage of the South East Europe Transnational Cooperation Programme website. At the top, there is a search bar with fields for 'User name' and 'password', and buttons for 'LOG IN' and 'SEARCH'. Below the search bar is a navigation menu with links for 'About SEE Programme', 'News and Events', 'Projects', 'Downloads', and 'Contacts'. The main content area features a map of Southeastern Europe with the text 'Jointly for our common future'. To the right of the map is a sidebar with the following sections:

- The South East Europe Transnational Cooperation Programme**: A brief description of the programme's goals and objectives.
- Latest news and events**: A section titled 'SEE Programme selects its first projects' with a 'Read more' link.
- Partner search**: A section titled 'DO YOU HAVE A PROJECT IDEA AND YOU ARE LOOKING FOR PARTNERS?' with a 'Read more' link.

DMCSEE – TCP-SEE project

15 partners from 9 countries

Total project budget 2.2 M€

Not all countries participate!
(not all countries are eligible)

DMCSEE – TCP-SEE project activities

Regional drought monitoring

- Overview of existing procedures for climatological mapping;
- Implementation of drought indices (SPI, PDSI, PAI,...)
- Maps available online.

Can we do better than just using global datasets (such as GPCP)?

SPI Aug 2010 (1 month)
GPCP first-guess analysis

Standardized precipitation index (SPI),
computed from GPCP data (Global
Precipitation Climatology Center)

Jointly for our common future

DMCSEE – TCP-SEE project activities

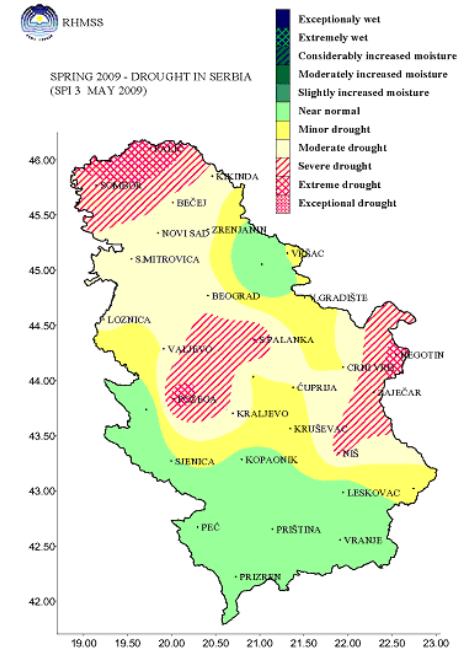

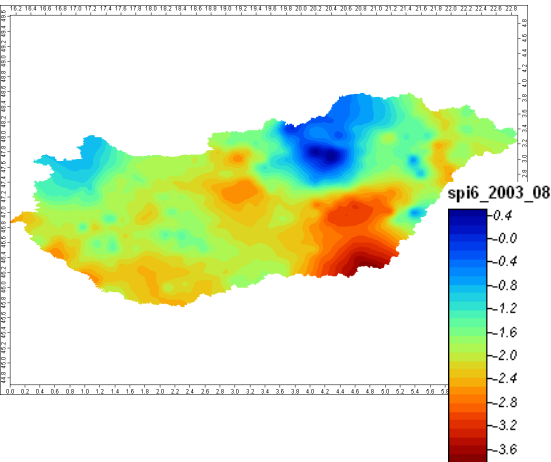

Climatological mapping

From regional to local implementation

- Calculation of SPI
- Mapping of SPI
- Dissemination

Map of SEE (2020)

Local capacity is the only way to guarantee sustainability
Neither a game of playing numbers nor producing nice-looking maps – usefulness

DMCSEE – TCP-SEE project activities

Regional vulnerability assessment to drought impacts

Factors that increase
vulnerability
in agriculture:

- **soil water holding capacity**
- terrain slope and aspect
- land use / land cover
- access to irrigation infrastructure etc

DMCSEE – TCP-SEE project activities

Water use efficiency in agriculture:

crop-water balance model WinIsareg (Pereira et al, 2010) Irrigation scheduling

southern European countries have the highest water use for irrigation. It represents around **78 %** of the total abstraction in southern Accession Countries.

Europe

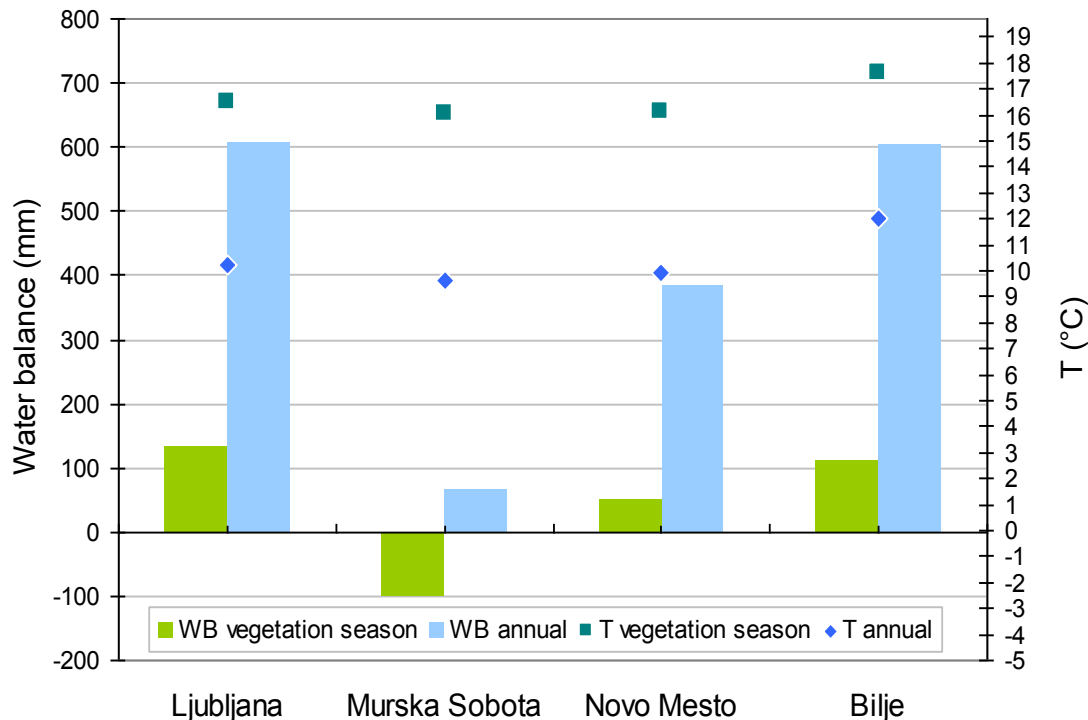

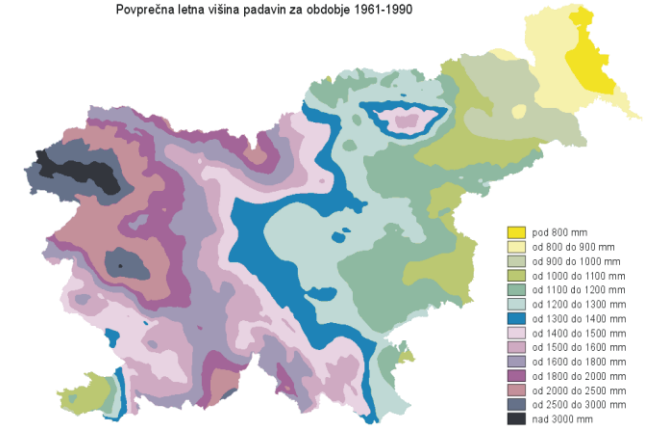

Case study for Slovenia

- Diversity of climate: (continental, alpine, sub-Mediterranean);
- Annual water balance in the period 1971-2000 sufficient, but vegetation period problems with rain distribution and high ETo
- NE part has average water deficit.

Povprečna letna višina padavin za obdobje 1961-1990

Meteorological data:

- Archive of EARS;
- Potential evapotranspiration (FAO Penman - Monteith).

Crop and Soil data

Crop

maize (*Zea mays*) hybrid Cisco

- Crop data referring to dates of crop development stages, crop coefficients (K_c); root zone depths Z_r (m); soil water depletion fractions for no-stress (p); and the seasonal water-yield response factor (K_y)

stages	date	root depth (m)	p	date	K_c
A - sowing	20.4.	0.01	0.4	30.4.	0.20
B - third leaf	7.5.	0.20	0.4	7.5.	0.50
C - tasseling	9.7.	0.50	0.4	11.5.	0.90
D - milky ripe	16.8.	0.50	0.4	28.6.	1.10
E - fully ripe	8.10.	0.50	0.4	9.7.	1.20
F - harvest	14.10.	0.50	0.4	16.8.	0.60
				20.9.	0.50

$K_y = 1.25$

Soil

Soil data for a multi-layer soil

The soil water content at field capacity θ_{FC} ($m^3 m^{-3}$) and the wilting point θ_{WP} ($m^3 m^{-3}$), or the total available water (TAW , mm)

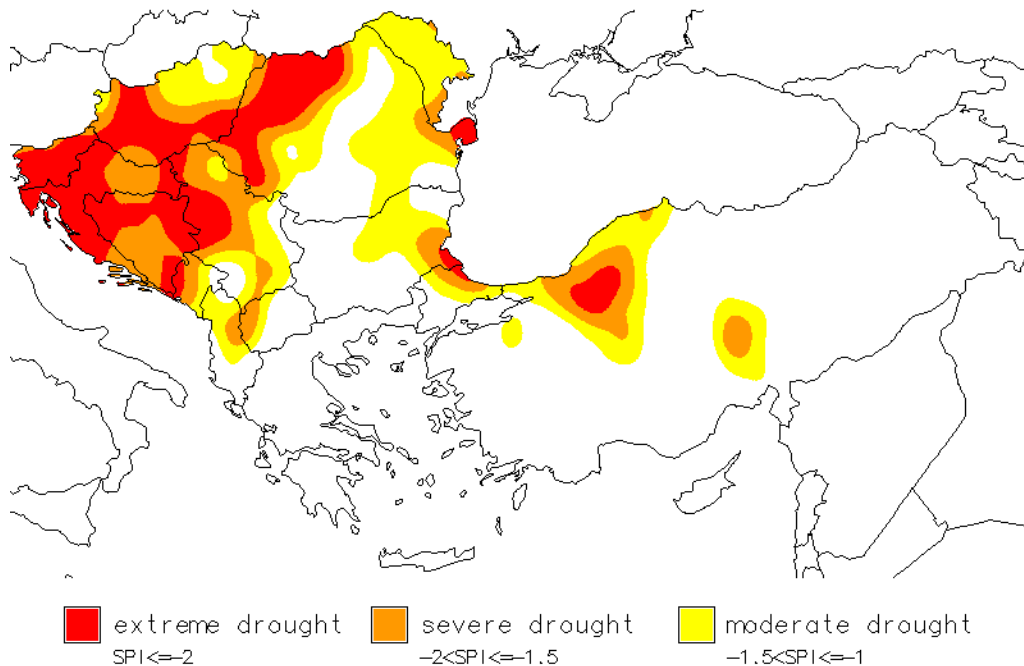

- Low Water Holding Capacity (78 mm)
- High Water Holding Capacity (156 mm)

Methods

Standardized Precipitation Index (SPI)

- probability distribution - average 1971-2000
- used time scale: 1- and 6-month

SPI Sep 2003 (6 months)
GPCC final analysis

SPI value:	drought category
2.00 and above	extremely wet
1.50 to 1.99	very wet
1.00 to 1.49	moderately wet
-0.99 to 0.99	near normal
-1.00 to -1.49	moderately dry
-1.50 to -1.99	severely dry
-2.00 and less	extremely dry

Water Balance

$$WB = RR - ET_0$$

FAO Penman - Monteith method

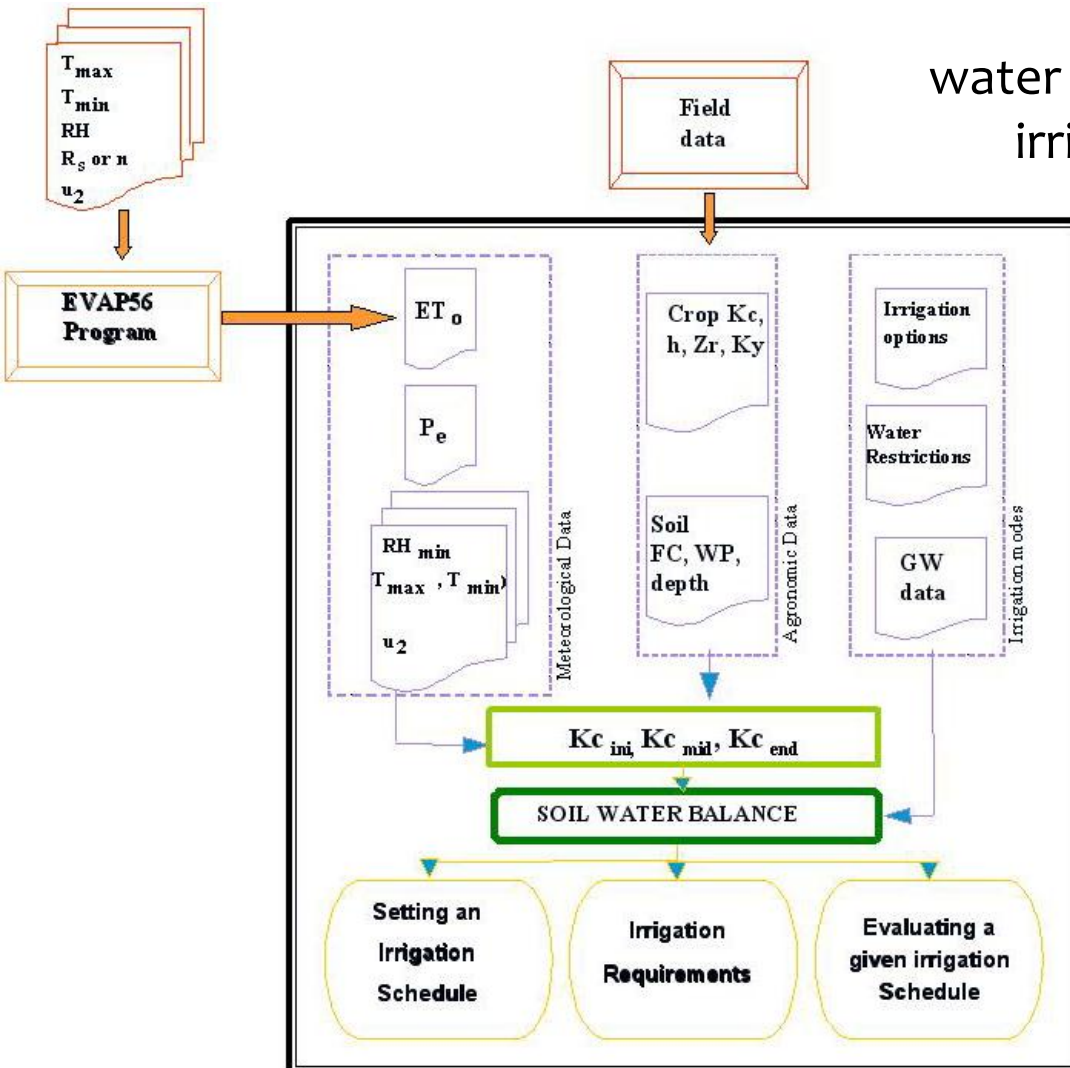

Methods

WinISAREG

water balance model for simulating crop irrigation schedules at field level.

NIR

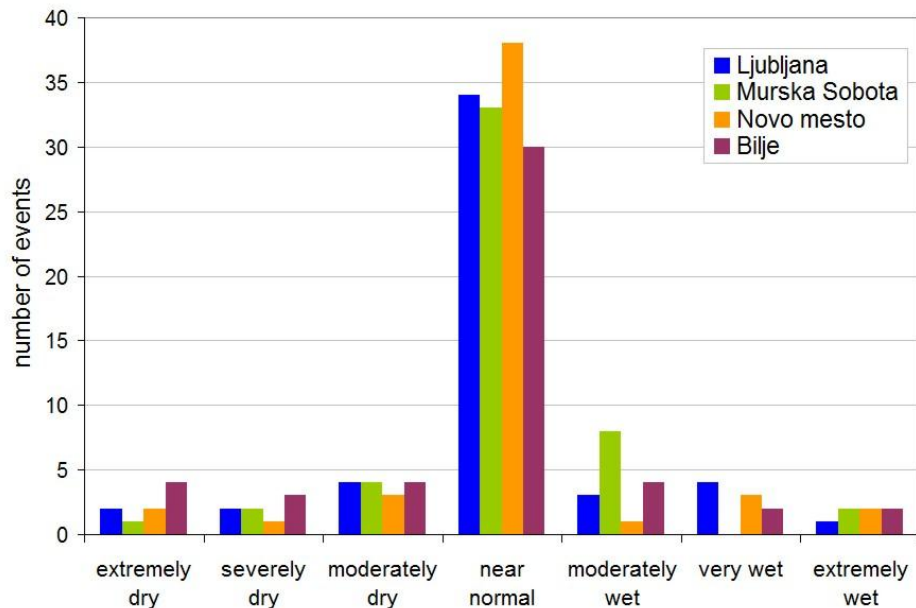

Net Irrigation Requirements

- agrometeorological reports of EARS (1960 – 2010)
- damage due to drought checked in reports of SURS (2010)
- trends

Analysis of vegetation seasons 1961 – 2010

Number of vegetation seasons

In 50 years SPI6 classified:

- 6-11 dry seasons;
- 6-10 wet seasons.

Minimum value of SPI6:
-4.26 (Bilje, 2003).

Standardized Precipitation Index 6 – month (SPI6)

Vegetation seasons classified in the range of **dry years**

SPI value:	drought category
2.00 and above	extremely wet
1.50 to 1.99	very wet
1.00 to 1.49	moderately wet
-0.99 to 0.99	near normal
-1.00 to -1.49	moderately dry
-1.50 to -1.99	severely dry
-2.00 and less	extremely dry

Analysis of vegetation seasons 1961 – 2010

Average vegetation water balance

Water Balance

Higher evapotranspiration rate: in last 10 years from 7 to 22 days with $ET_o > 5$ mm more than in 1971-2000.

Number of days with $ET_o > 5$ mm

- the highest water deficit in Murska Sobota (NE Slovenia);
- decreasing water balance in the last 10 years (Ljubljana is and exception).

Analysis for vegetation seasons 1961 – 2010

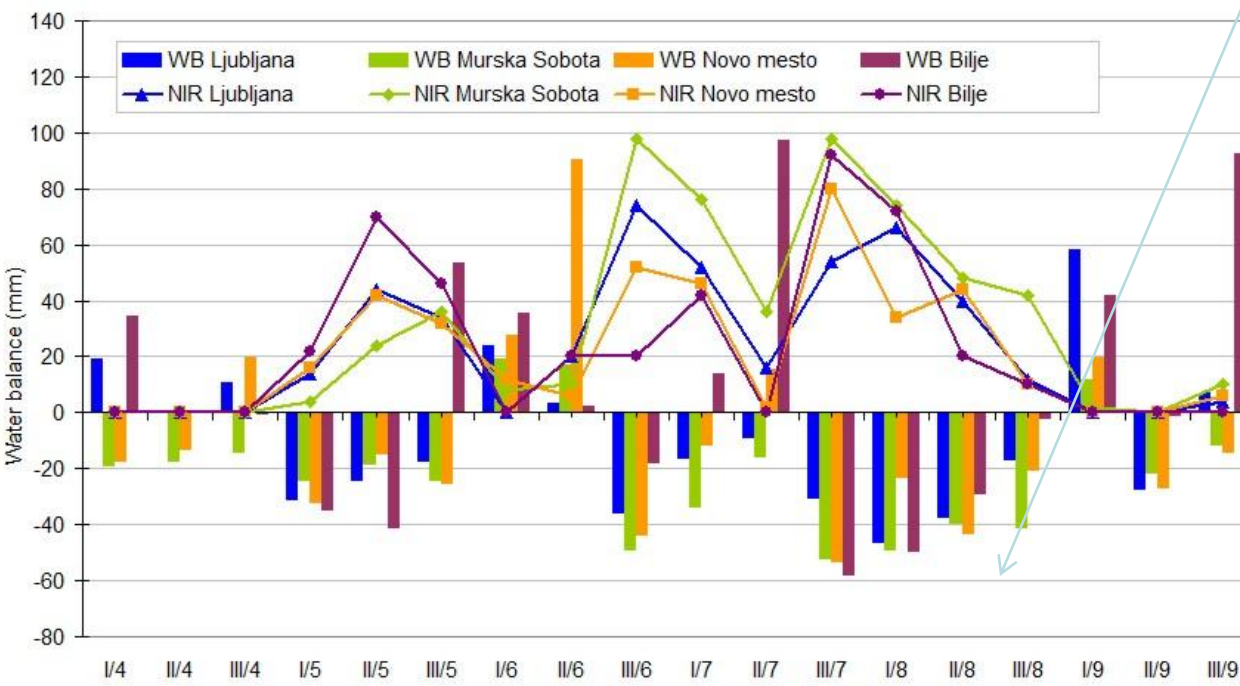

Net Irrigation Requirements

Classification of seasons according to NIR

- Years in the range between 80 % and 100 % determined **as dry**;
- Average difference of NIR between soils of LWHC and HWHC from 52 to 65 mm.

Year 1992 – drought development

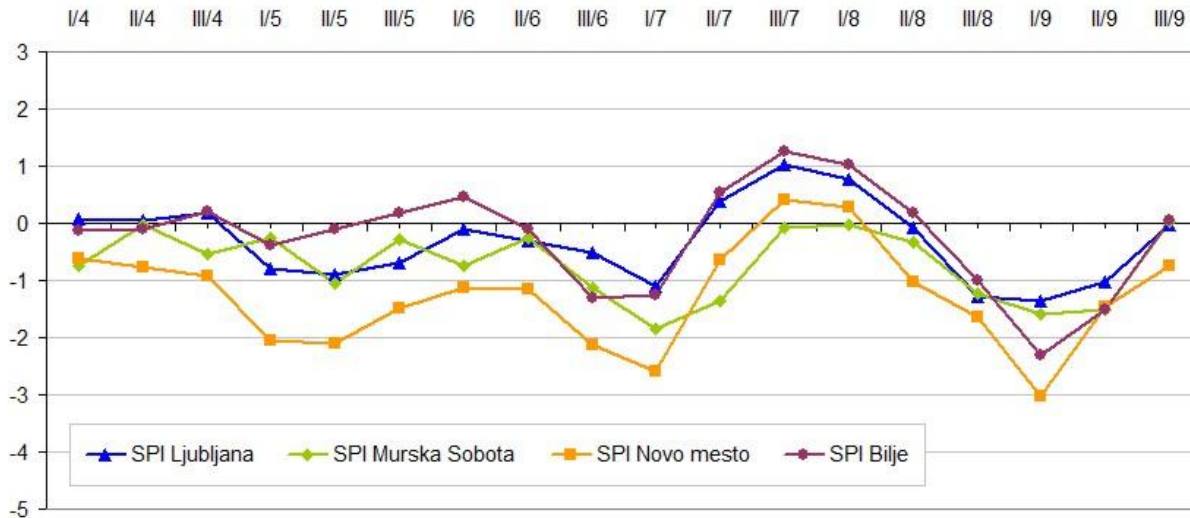

- SPI1 shows two major dry spells (end of May and in August);
- extreme drought(according to SPI6) in Murska Sobota from 3rd decade of July until the end of the season;
- 3 major periods with negative water balance, which reflects on NIR;
- the largest irrigation water consumption in Murska Sobota from 3rd decade of June, which fits with SPI;
- the highest magnitude and the longest duration of drought in MS.

REPORTS:

- most extreme drought in Murska Sobota;
- drought at all parts of Slovenia;
- 70 to 90% of maize crops damaged due to drought.

Year 2000 – drought development

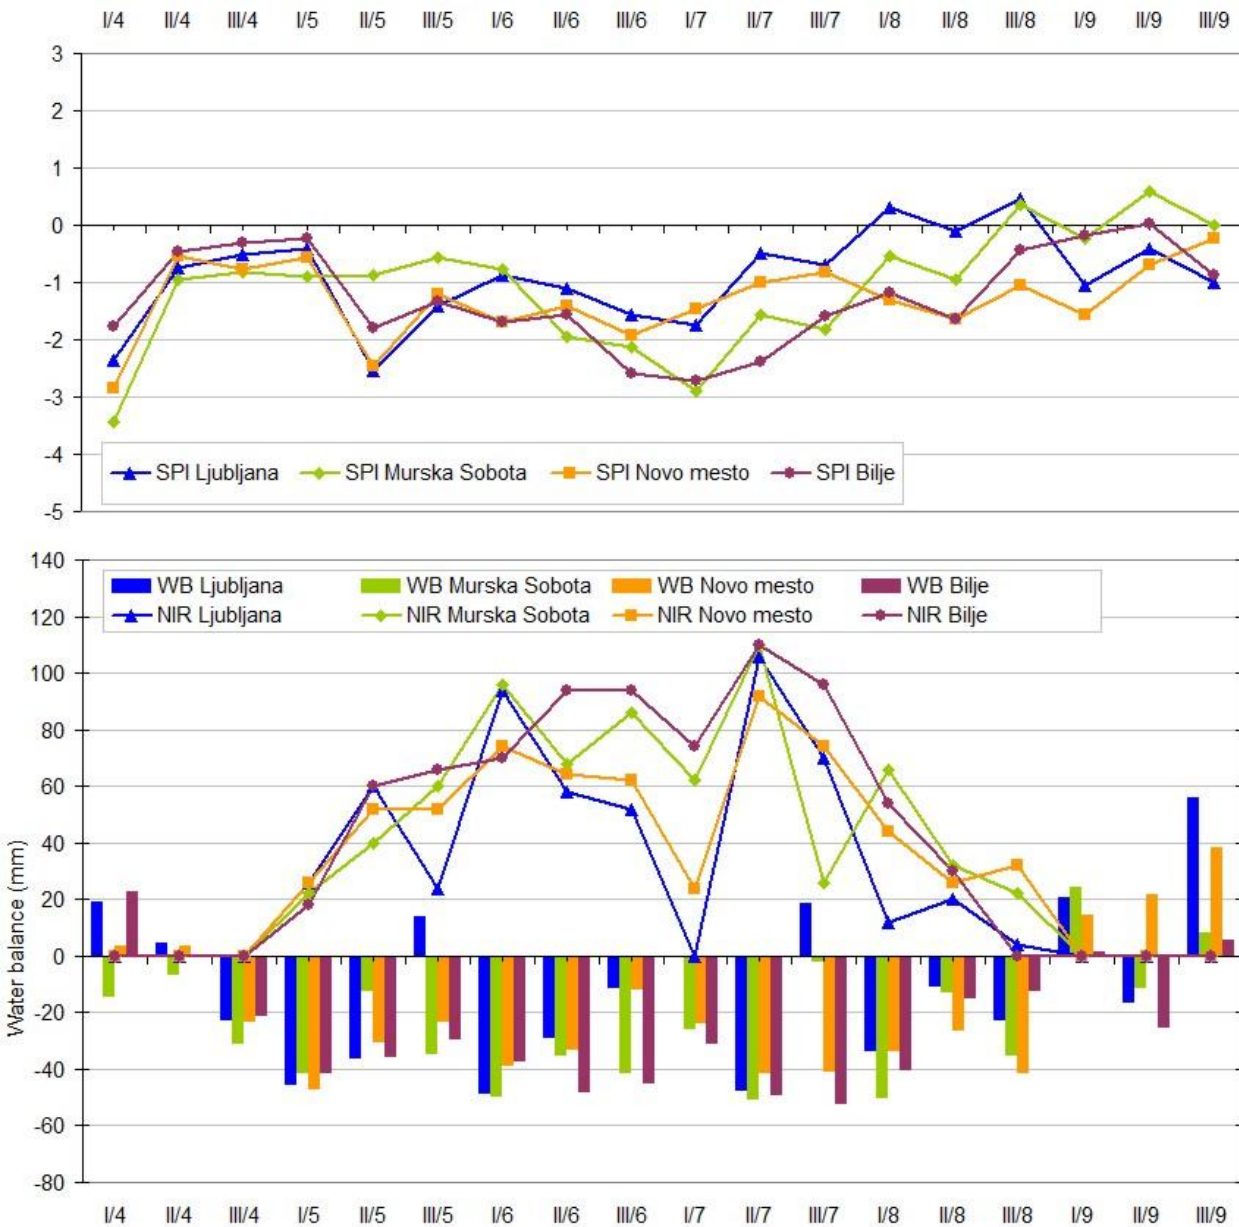

- According to SPI1 was drought in Novo mesto and Murska Sobota; only at the end of the season were at all four locations;
- three intervals of extreme drought (SPI6) in Novo mesto;
- irrigation needed through the all season with exception at 2nd decade in July, which reflect in positive WB and normal (even moderately wet) SPI1.

REPORTS:

- first interval of agricultural drought in the middle of April
- second dry interval in the summer;
- the most severe agricultural drought in the 10 – year period from 1990 to 2000;
- maximum damage recorded in maize crops;
- crop yield in Murska Sobota, Novo Mesto and Bilje reduced by 20 – 30 %.

Year 2003 – drought development

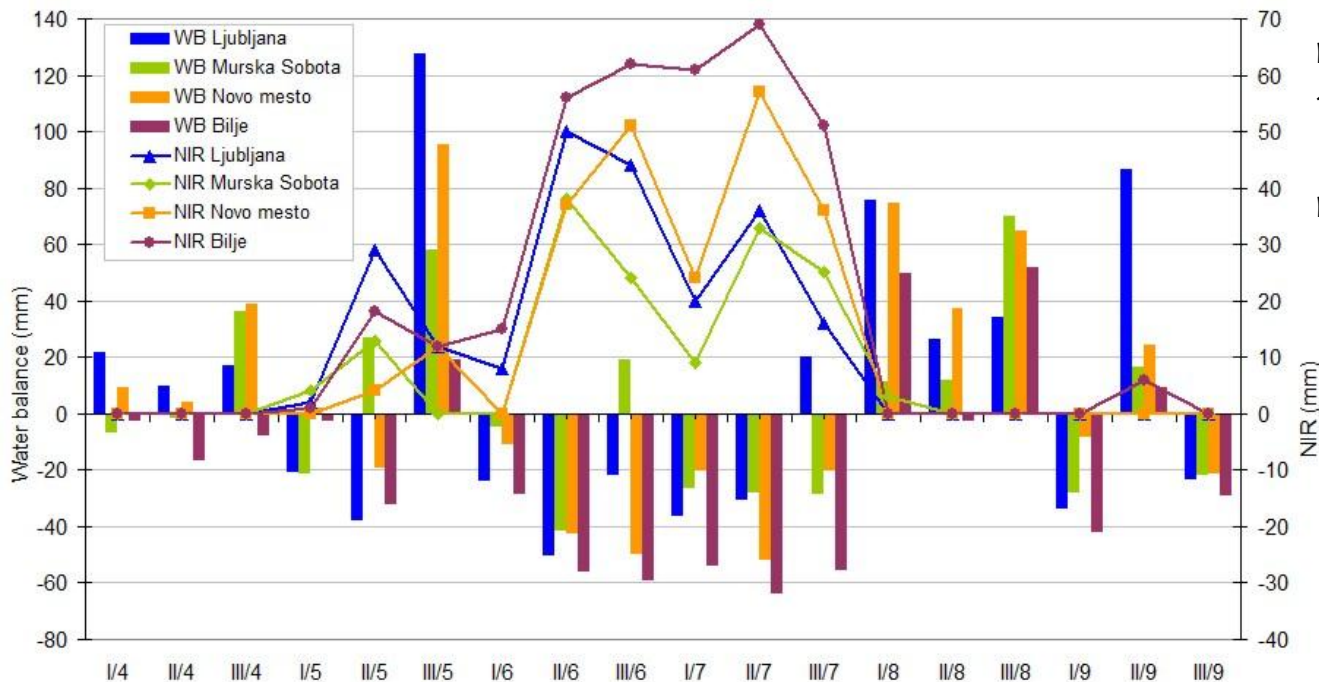

- SPI1 detects already extreme spring drought;
- according to SPI1 drought last through all the season, conditions getting better in August but still on the dry side;
- slightly better conditions only in Ljubljana;
- negative WB almost all the vegetation season;
- consumption of irrigation water in season: Bilje 383 mm, Murska Sobota 345 mm, Novo mesto 311 mm and Ljubljana 263 mm.

REPORTS:

- drought lasted from the end of April up to second decade of July;
- natural disaster ranked amongst the worst in the previous 50 years;
- maize on shallow and sandy soils visibly lagged behind the normal growth;
- 70 % of Slovenian agricultural area distressed;
- damage assessed to 4.000 million €.

Year 2006 – drought development

- June and July were extremely dry according to SPI1 in Bilje, Novo mesto and Ljubljana;
- the largest WB deficit in Bilje;
- normal conditions only in Murska Sobota;
- one extreme peak in NIR in June and July;
- irrigation water consumption in June and July together : Bilje 314 mm, Novo mesto 205 mm and Ljubljana 174 mm;
- drought in 2006 was regional.

REPORTS:

- summer drought, intensified till the end of July at whole Slovenia;
- In Bilje maximum damage due to drought was recorded in maize crops;
- maize crop yield reduced by 40 to 90%.

Trend analysis

		Ljubljana	Murska Sobota	Novo mesto	Bilje *
ETP in vegetation season	absolute change (mm/10 years)	14.6	20.4	10.1	42.5
	relative change (%/10 years)	+ 2.4 **	+ 3.4 **	+ 1.7	+ 6.6 **
ETP > 5 mm in vegetation season	absolute change (NOD/10 years)	4.1	4.6	3.6	10.0
	relative change (%/10 years)	+ 18.6 **	+ 31.7 **	+ 18.1 **	+ 41.1 **
NIR for LWHC in vegetation season	absolute change (mm/10 years)	13.9	14.4	11.8	26.7
	relative change (%/10 years)	+ 8.8	+ 8.7	+ 7.2	+ 14
NIR for HWHC in vegetation season	absolute change (mm/10 years)	14.4	13.4	13.1	22.0
	relative change (%/10 years)	+ 15.5	+ 11.6	+ 12.8	+ 17.3

* Bilje from year 1962.

- statistically significant increase of ETo;
- statistically significant increase of days with ETo > 5 mm;
- increasing Net Irrigation Requirement;
- decreasing water balance (from -64.0 mm to -13.4 mm).

Future role of DMCSEE after 2012?

Understanding of the problem
Regional drought & regional vulnerability to drought impacts

Proper Planning

Informed decision making (promote and strengthen the capacity for drought preparedness)

set-up permanent Drought Management Centre for SE Europe?

Drought Risk Reduction

exchange of knowledge, experience and best practice on drought issues
(**SEE network**)

raise awareness of decision makers, relevant stakeholders and end users about importance of effective drought preparedness, monitoring and management.

Jointly for our common future

Visit DMCSEE web page for update

http://www.dmcsee.org/en/drought_bulletin/

Drought Management Centre for Southeastern Europe - DMCSEE

Drought is a normal part of climate in virtually all regions of the world. South Eastern Europe is no exception; in past decades the drought-related damages have had large impact on the economy and welfare. Therefore the need to establish a Drought Center for SE Europe to alleviate the problems caused by drought in the area became evident at the end of the past century. The idea was further elaborated by International Commission on Irrigation and Drainage (ICID) and UN Convention to Combat Desertification (UNCCD). The UNCCD national focal points and national permanent representatives with the World Meteorological Organization have agreed upon the core tasks of the Drought Management Center for South Eastern Europe (DMCSEE) and the proposed project document.

The mission of the proposed DMCSEE is **to coordinate and facilitate the development, assessment, and application of drought risk management tools and policies in South-Eastern Europe with the goal of improving drought preparedness and reducing drought impacts**. Therefore DMCSEE will focus its work on monitoring and assessing drought and assessing risks and vulnerability connected to drought.

In 2010 we have started to publish **Drought Bulletin for SE Europe**. **Bulletin** contains following sections:

Hot spot - short summary, possibly including a figure. It aims at very short insight of possible circumstances of drought at the time of issue.

Additional and auxiliary information (such as methodology used, more detailed information on water balance or temperature situation)

Report on impacts; content of this section is based on information available in electronic media on the internet. To improve the information, you are most welcome to participate by informing us on drought impacts in the current season in your region. Send your contribution and comments through our [contact](#). Also any other comments on the bulletin content would be highly appreciated.

Please find published issues of bulletin on the web.

Hot Spot

Numerical weather prediction model simulations for the time period 30 June - 7 September 2010 indicate dry conditions in parts of western and southern Balkan and relatively wet conditions in Carpathian region and Pannonian plain. Negative anomalies with respect to long term average (1989-2009) remained moderate, reaching negative values of 150mm. Situation has changed with respect to July conditions; some parts of the region became drier and warmer with respect to long term average.

Jointly for our common future
